Data Structures Jul 28 2022 *Data Structures: Abstraction and Design Using Java* offers a coherent and well-balanced presentation of data structure implementation and data structure applications with a strong emphasis on problem solving and software design. Step-by-step, the authors introduce each new data structure as an abstract data type (ADT), explain its underlying theory and computational complexity, provide its specification in the form of a Java interface, and demonstrate its implementation as one or more Java classes. Case studies using the data structures covered in the chapter show complete and detailed solutions to real-world problems, while a variety of software design tools are discussed to help students "Think, then code." The book supplements its rigorous coverage of basic data structures and algorithms with chapters on sets and maps, balanced binary search trees, graphs, event-oriented programming, testing and debugging, and other key topics. Now available as an enhanced e-book, the fourth edition of *Data Structures: Abstraction and Design Using Java* enables students to measure their progress after completing each section through interactive questions, quick-check questions, and review questions.

The Structure of Scientific Examination Questions Sep 29 2022 This book shows how Systemic Functional Linguistics may be used to explore and explain the grammar of scientific examination questions. The author outlines the key elements of this theory and identifies problematical structures that affect the linguistic validity of such education assessment questions. This book also shows how examination questions may provide insight into the relationship between teaching and language in science. Do candidates give an incorrect answer because they do not understand the topic or because they do not understand the language by which the question is framed? This book shows how the analysis of scientific examination questions can answer this question. These chapters show how contemporary linguistics can inform the assessment of science and address topics including: the role of images, lexicography, the morphology of sentences, semantic discontinuity and the active reader. An example question is used throughout the text to illustrate the theories and each chapter has its own useful summary, making it a very readable work.

Discourse-Related Features and Functional Projections Dec 21 2021 In this volume Silvio Cruschina uses a comparative analysis to determine the syntax of the functional projections associated with discourse-related features, and to account for the marked word orders found in Romance - particularly in the fronting phenomena. Several language-specific analyses of discourse-related phenomena have been proposed in the literature, including studies on the notions of topic and focus in Romance, but the lack of a uniform definition of these notions, together with different assumptions in relation to the triggering features, has led to the perception that the Romance languages show many distinct and heterogeneous properties with respect to dislocation and fronting constructions. This volume is intended to complement the existing literature by integrating recent work on the topic and by emphasizing original and unifying reflections that combine and coordinate diverse elements. Cruschina's investigations clarify fundamental notions such as topic, focus, and contrast, drawing on new data from Sicilian, Sardinian, and other Romance varieties.

Problem Solving with Algorithms and Data Structures Using Python Jun 26 2022 THIS TEXTBOOK is about computer science. It is also about Python. However, there is much more. The study of algorithms and data structures is central to understanding what computer science is all about. Learning computer science is not unlike learning any other type of difficult subject matter. The only way to be successful is through deliberate and incremental exposure to the fundamental ideas. A beginning computer scientist needs practice so that there is a thorough understanding before continuing on to the more complex parts of the curriculum. In addition, a beginner needs to be given the opportunity to be successful and gain confidence. This textbook is designed to serve as a text for a first course on data structures and algorithms, typically

taught as the second course in the computer science curriculum. Even though the second course is considered more advanced than the first course, this book assumes you are beginners at this level. You may still be struggling with some of the basic ideas and skills from a first computer science course and yet be ready to further explore the discipline and continue to practice problem solving. We cover abstract data types and data structures, writing algorithms, and solving problems. We look at a number of data structures and solve classic problems that arise. The tools and techniques that you learn here will be applied over and over as you continue your study of computer science.

Mathematics across the Iron Curtain Aug 05 2020 The theory of semigroups is a relatively young branch of mathematics, with most of the major results having appeared after the Second World War. This book describes the evolution of (algebraic) semigroup theory from its earliest origins to the establishment of a full-fledged theory. Semigroup theory might be termed 'Cold War mathematics' because of the time during which it developed. There were thriving schools on both sides of the Iron Curtain, although the two sides were not always able to communicate with each other, or even gain access to the other's publications. A major theme of this book is the comparison of the approaches to the subject of mathematicians in East and West, and the study of the extent to which contact between the two sides was possible.
